HIDI Advantage Optics
Hospital-Specific Health Equity Dashboards

Patient-Specific Insights At Your Fingertips

Hospitals' pursuit to provide better care and achieve better health for individuals at lower cost isn't new. Neither is the notion that eliminating health disparities will improve care quality and outcomes. However, promoting health equity through accreditation and payment standards is.

To comply and improve, hospitals first must gain visibility into the care they provide to their specific patient populations through a sociodemographic lens. That's why HIDI recently deployed **Hospital-Specific Health Equity Dashboards** as the newest offering in the HIDI Advantage Care Optics platform.

The new dashboards stratify hospital-specific administrative claims data into key sociodemographics, such as race, ethnicity, age and gender. The ability to analyze quality and safety data in this way provides hospitals with unprecedented visibility into the potential drivers of health care disparities, specific to their patient populations — a vantage point that's critical when allocating finite resources for targeted improvements.

Key Features

- helps hospitals meet and exceed the new CMS and TJC data reporting requirements
- includes timely, complete hospital discharge data, as well as established risk-adjusted measures and SDOH content
- stratifies sociodemographic patient data by race, ethnicity, age, gender, insurance status and social complexity
- provides highly flexible peer group benchmarking options
- integrates with EHR and other clinical data systems through patient-level drill-through
